LEARN TODAY FOR A CHANGING
WORLD

GAVIN DYKES

GAVIN.DYKES@BTINTERNET.COM

I was born in Scotland and started school there. In 1968 I moved from the borders of Scotland down to London. To England. A different country, a different education system, a different curriculum. In my last months in school in Scotland, we were taught computer programming – in Algol.

When I moved to an English school, there was no computing. In fact, I didn't meet computing again until 5 years later and I went university. Basic and Fortran were the languages I met there, but it didn't seem to matter. I took to them well.

I wonder now if alongside developing knowledge of Algol the language, we were taught the computational thinking skills. If it is the case, I've a lot to be thankful for, because those computational thinking skills have been an important foundations to my career.

THREE AGES OF INFORMATION

- Pre-book: Challenge is finding information
- Book: Challenge is indexing information
- Post book: Challenge is navigating over abundance

<http://www.youtube.com/watch?v=sSPA64locSQ>
Dr Bill Rankin

Dr Bill Rankin is a medieval historian. He taught at Abilene Christian University in the United States, and then became Apple's Director of Education.

While at Abilene Christian University he gave one of my favourite presentations, on the three ages of information.

Pre-book – Book – and Post-book

Pre book - you had to travel the world to find an expert in your chosen field then hope to work as an apprentice to that expert.

At the start of the book era, information was still scarce and you would travel the world to find an expert, who might well lecture, reading from his or her book, as you painstakingly copied out what the expert read – you made your own book.

Then Gutenberg came along and printed so many books that we need to develop filing systems and indexes to find our way around all the information available. Editors and publishing houses controlled what was printed and what we read and saw. It didn't mean everything was right, nor did it mean everything was balanced.

Now we're in the post-book age and we are awash with information. It's like we all have and use our own personal printing presses. To cut through this we require a set of skills, to find information we want (and not be distracted), to validate that information, to synthesize it into cogent arguments or stories.

We also have algorithms to sift the information. That may sound negative. But if you are ill, is it better to have a doctor use his or her knowledge (which may not be completely up to date, which could be limited to one country's research) to diagnose you, or could it be good to have an algorithm that searches through all published research to come up with the diagnosis. That's a question for IBM's Watson.

I know my answer – I'd like IBM Watson to do the research, and a doctor to discuss the outcomes with me.

PRE-BOOK

Teaching the first age

Only place to get information is from the minds and mentorship of people you meet

Teachers live and work in relationship with students

Teachers serve as guides or mentors, emphasising learning by practice and apprenticeship

Emphasis on contextual learning, using knowledge in particular contexts

Repetition and assessment lead to independent praxis (which is the process by which a theory, lesson, or skill is enacted, embodied, or realized)

Learning as embodied, subjective, dialectic and broadly interconnected

BOOK

+ Johannes Gutenberg's printing press (around 1450 in Strasbourg)

+ Note William Caxton brought the printing press to England in 1476 (which is what I learned in English History)

Teaching in the second age

Abundant information that can be put in order

Teachers serve as the primary conduit of information with students as receivers

Emphasis on classifying and cataloguing

Focus on memorisation of facts and data

Repetition is primary, analysis is secondary

Learning as hierarchical, "Objective", standardised, and narrowly defined

POST-BOOK

Teaching in the third age

Over-abundance of information that can be accessed, validated and navigated in part through technology (used to say amount of information doubles – Every day we create 2.5 Quintillion bytes of data) In the last two years we have created 90% of the World data today.

Teachers live and work in relationship with students

Teachers serve as guides or mentors, emphasising learning by practice and apprenticeship

Emphasis on contextual learning, using knowledge in particular contexts

Repetition and assessment lead to independent praxis (which is the process by which a theory, lesson, or skill is enacted, embodied, or realized)

Learning as embodied, subjective, dialectic and broadly interconnected

HOW TO GET A JOB AT GOOGLE

- COGNITIVE ABILITY – LEARNING ON THE FLY
- EMERGENT LEADERSHIP
- HUMILITY
- OWNERSHIP
- EXPERTISE

<https://www.nytimes.com/2014/02/23/opinion/sunday/friedman-how-to-get-a-job-at-google.html>

If we're living in a world where information is overabundant, what kind of skills are employers looking for?

Thomas Friedman, author of the World is Flat, researched and wrote about this in a 2014 article in the New York Times. He found the five key things that the job interviewers from Google were looking for were:

Cognitive ability
Emergent leadership
Humility
Ownership
Expertise

THINK

From slides shared by Jim Wynn

The Atlas of Economic Complexity: Mapping Paths to Prosperity (Ricardo Hausmann et al) analyses on the economics of the world, and the relative success of different countries, through their products
Least complex products are: Raw cotton; Tin ores and concentrates; Natural rubber; Sesame seeds; Cocoa beans
Most complex products are:

Welding, brazing, cutting machines and appliances; Chemical products and flashlight materials for use in photography; Appliances based on the use of X-rays or radiation; Instrument and appliances for physical or chemical analysis; Other machine tools for working metal or metal carbide.

Hausmann et al argue that products are vehicles for knowledge and the process of embedding knowledge in products requires people who possess a working knowledge of that knowledge.

Hausmann quotes Adam Smith in describing the division of labour as the secret wealth of nations. **We rely on plumbers, dentists, lawyers, meteorologists and mechanics to sustain our style and standard of living. Markets and organisations allow the knowledge held by a few to reach many.**

Knowledge in society is does not depend on how much each individual knows, it depends on the diversity of knowledge across individuals, and on their ability to combine this knowledge and make use of it through complex webs of interaction.

The secret of modernity is that we collect and use large volumes of specialist knowledge, while each one of us holds only a few bits of it.

Next time you bite into an apple think of the thousands of years of plant domestication (from the start of apple growing in Kazakhstan), combined with knowledge of logistics to get the apple into your hands, refrigeration, pest control, food safety and preservation of fresh produce – so apples have relatively high complexity.

Hausmann et al argue that products are vehicles of knowledge and the process of embedding products requires people who possess a working understanding of that knowledge.

Perhaps we can conclude we need the knowledge and frameworks of understanding and skills of communication, problem solving and learning. We also can conclude something about the sustainability and value of work at the upper end of the value chain.

MYTHS AND TRUTHS

IT'S A DIGITAL CHOICE BETWEEN KNOWLEDGE AND SKILLS

TRADITIONAL TEACHING HAS NO VALUE IN TOMORROW'S WORLD

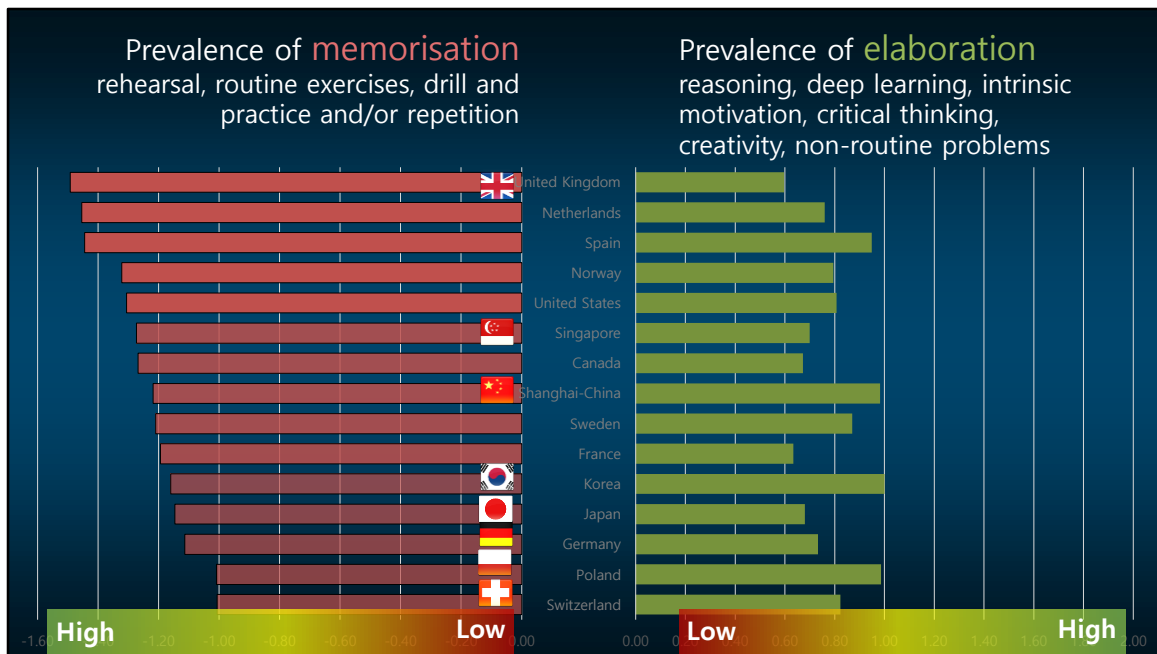

IT'S A DIGITAL CHOICE BETWEEN SCIENCE AND THE ARTS

KNOWLEDGE DEVELOPMENT REQUIRES ROTE LEARNING

MORE MEANS BETTER

Knowledge building pedagogies recognise the value of established knowledge, but also insist that students need to be able to *do* knowledge work as well as learning *about* established knowledge.

Above all, this means students should acquire the ability to recognise, generate, represent, communicate, deliberate, interrogate, validate and apply knowledge claims in light of established norms in key subject domains.

STUDENT ENGAGEMENT....

ASPIRE HIGH.....Russ Quaglia, Mickey Corso, Kris Fox and Gavin Dykes...

What have you learned from students about teaching and learning? What have students taught you, either directly or indirectly, about best educational practices?

Describe a time that a student's or a group of students' different perspective mad you think differently. What was your starting point of view? How did it change as a result of the student point of view?

IMPLEMENTING POLICY AND STRATEGY ENGAGE STAKEHOLDERS

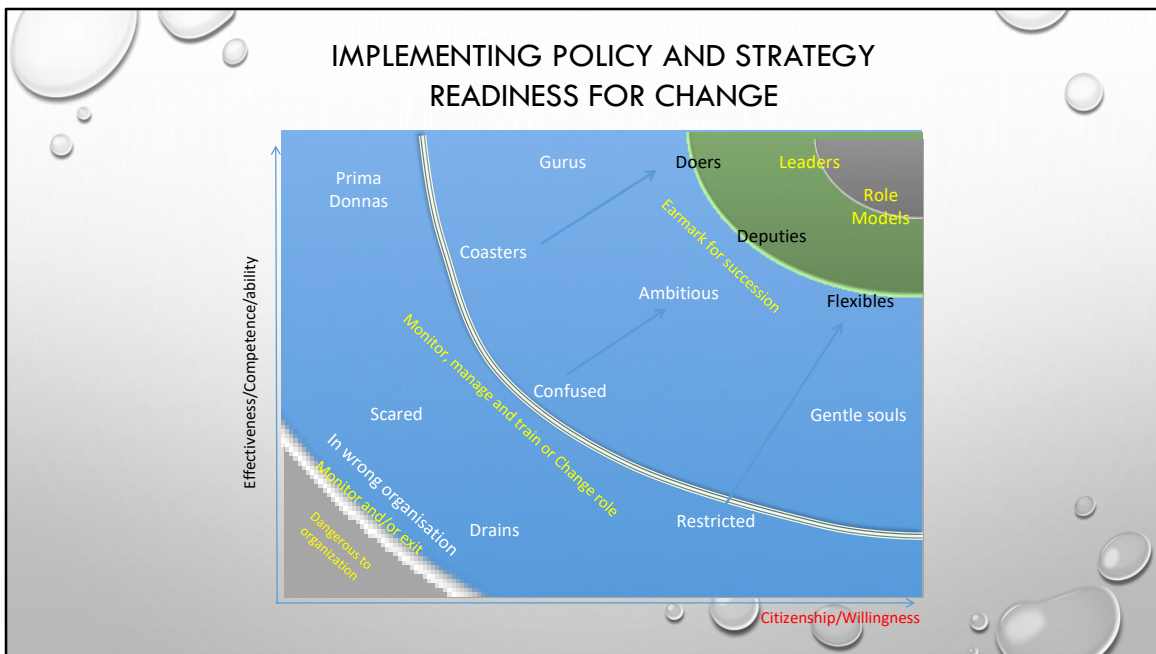

Malta – third advisor to be brought in, could learn from other two. Learned that vision and investment – the way policy often works, but the implementing partners. Learned two important things – not about my prejudices and what I wanted, but what stakeholders wanted otherwise it wouldn't be implemented. Major work was conducting SWOT analysis with students, teachers, school leaders, policy makers and the education ministry, the community, special educational needs, commercial companies working with education, university, colleges

IMPLEMENTING POLICY AND STRATEGY BUILD NETWORKS AND COMMUNITIES OF PRACTICE

- (1) PROVIDE SIGNIFICANT FUNDING FOR FACE-TO-FACE EVENTS
- (2) ENSURE COMMUNITY ACTIVITIES ADDRESS BUSINESS ISSUES
- (3) PROVIDE COP LEADER TRAINING
- (4) ENSURE COP LEADERS ARE GIVEN SUFFICIENT TIME FOR THEIR ROLE
- (5) ENSURE HIGH LEVELS OF SPONSOR EXPECTATION
- (6) ENGAGE MEMBERS IN DEVELOPING GOOD PRACTICE
- (7) IMPROVE THE USEFULNESS OF ICT TOOLS PROVIDED
- (8) ENSURE THERE ARE CLEARLY STATED GOALS
- (9) PROMOTE COPS ABILITY TO HELP EMPLOYEES SOLVE DAILY WORK CHALLENGES

SWAMP THEORY

Different people have different roles to play. Just as we personalise learning for students, so we need to think about personalised learning for teachers and even personalised engagement for stakeholders....

Have wider support for your broad policy objectives

There exists a narrow and traditional view of curriculum that conceives of it as a collection of study plans, syllabi, and textbooks. This view is incomplete and fails to see the holistic value of curriculum in supporting the acquisition of the broader essential competencies that citizens must possess to ensure national, regional, and global development.

More recently, UNESCO articulated competencies for sustainable development (see Table 1).

Several other related competencies of sustainable development goal 4.7 included the following:

Citizenship:

Anticipatory: the ability to understand and evaluate multiple futures

Normative: the ability to understand and reflect on the norms and values that underlie one's actions

Strategic: the ability to collectively develop and implement actions and further sustainability;

Collaboration: the ability to learn from others

Critical thinking the ability to question norms, practices and opinions,

Self-awareness: the ability to reflect on one's own role in the local community and (global) society

Integrative problem-solving: the overarching ability to apply different problem-solving frameworks to complex sustainability problems

IMPLEMENTING POLICY: AND STRATEGY
ENGAGING SCHOOL COMMUNITIES

3a. Teaching and the learning process

3a1: Breadth of development for ICT capability

LEVEL 5

Teaching offers pupils a narrow range of ICT experiences which are mainly focused on low-level tasks and skills.

LEVEL 4

Teaching is inconsistent and pupils have a limited range of opportunities to develop their ICT capability. There is an over-emphasis on skill development at the expense of knowledge and understanding.

LEVEL 3

Teaching provides opportunities that enable many pupils to experience most aspects of ICT with an appropriate balance between knowledge, skills and understanding.

LEVEL 2

Teaching enables most pupils to use and develop all aspects of their ICT capability through a wide range of experiences and contexts that are consistently matched to their needs, abilities and learning preferences.

LEVEL 1

Teaching enables all, or nearly all, pupils to develop and use their ICT capability with confidence through a wide range of appropriate contexts and challenging experiences. Teaching builds effectively on pupils' use of ICT beyond the school.

Becta's self-review framework for ICT

Leadership and Management
Planning
Learning
Assessment of ICT capability
Professional Development
Resources

Critical element is convening the conversations and exchanges that help build community, to learn from different stakeholders within the community and to value and use their contributions....

GOVERNANCE STRUCTURES

EFFECTIVE ENGAGEMENT OF STAKEHOLDERS

ALIGNMENT

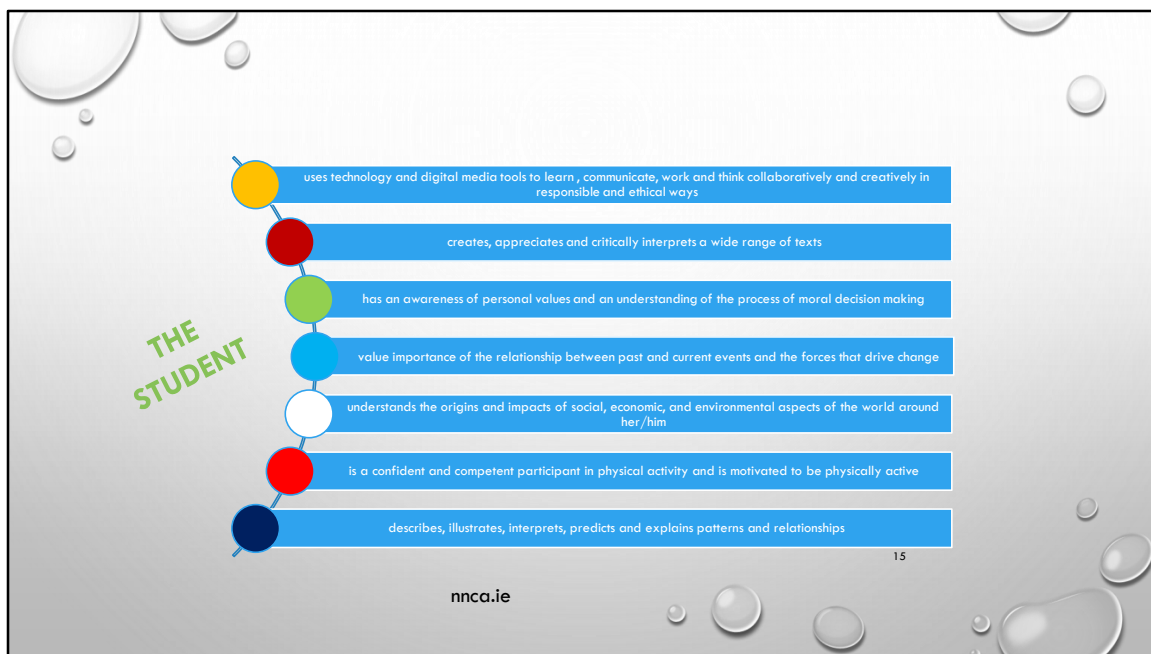

EVALUATING IMPACT

PLACING STUDENTS AT CENTRE

Japan – children playing on monocycles. Over 10 years ago, one half day per week has no curriculum.

During 2016, the Norwegian parliament considered the renewal of subjects in the primary and lower secondary education curricula, and general subjects of the upper secondary curriculum with an aim to define fewer and clearer competence goals. Several consultations were held on skills that will power the country's future prosperity as well as what ought to be schools of the future.

Ireland's Statements of Learning

Fred

genuine learning is based on activity

we need to set more consistent
examples for the teachers of tomorrow

this means that we have to radically
rethink teacher education

Since 2012, Finland launched its national curriculum reform. The reform addressed questions pertaining to:

- (i) the meaning of education in the future,
- (ii) types of competencies that will be needed,
- (iii) practices that would best produce desired education and learning,
- (iv) competencies required in society and the changed working life, and
- (v) skills required to build a sustainable future.

(vi) Examples of basic education competencies include:

- (i) thinking and learning,
- (ii) cultural competence, interaction and expression,
- (iii) looking after oneself, managing daily activities, safety,
- (iv) multi-literacies,
- (v) ICT competence,
- (vi) competence required for working life and entrepreneurship, and
- (vii) participation, empowerment and responsibility (Halinen, 2016).
